

WHAT IS CLAIMED IS:

1 1. An acoustic monitoring method in laser-induced optical
2 breakdown (LIOB), the method comprising the steps of:
3 causing at least one acoustic wave associated with a microbubble to
4 propagate in a volume of material;
5 detecting the at least one acoustic wave to obtain at least one signal;
6 and
7 processing the at least one signal to obtain information which
8 characterizes the material, the microbubble in the material or a microenvironment
9 of the microbubble.

1 2. The method as claimed in claim 1, the information
2 characterizes the mechanical microenvironment of the microbubble.

1 3. The method as claimed in claim 2, wherein the information
2 characterizes the viscoelasticity of the microenvironment.

1 4. The method as claimed in claim 1, wherein the information
2 characterizes microbubble size.

1 5. The method as claimed in claim 1, wherein the at least one
2 acoustic wave includes at least one acoustic wave reflected from the microbubble.

1 6. The method as claimed in claim 5, wherein the at least one
2 reflected acoustic wave includes an ultrasound wave.

1 7. The method as claimed in claim 1, wherein the at least one
2 acoustic wave includes an acoustic shock wave which propagates outwardly from
3 an LIBO site and defines an acoustic point source.

1 8. The method as claimed in claim 7, wherein the microbubble
2 is LIOB-induced and wherein the acoustic shock wave defines position of the LIOB-
3 induced microbubble which acts as an acoustic reflector.

1 9. The method as claimed in claim 7, wherein the point source
2 is determined by location of an additive in the material and wherein the additive
3 enhances an electric field in the vicinity of the additive.

1 10. The method as claimed in claim 9, wherein the information
2 characterizes a photodisruption threshold of the material with the additive which is
3 substantially lower than a photodisruption threshold of the material without the
4 additive.

1 11. The method as claimed in claim 10, wherein the information
2 quantifies concentration of the additive.

1 12. The method as claimed in claim 11, wherein a single molecule
2 of the additive is detected.

1 13. The method as claimed in claim 9, wherein the material
2 includes at least one nanodevice having the additive and a linked therapeutic agent
3 and wherein at least one laser pulse causes the at least one nanodevice to release the
4 linked therapeutic agent into the microenvironment.

1 14. The method as claimed in claim 13, wherein the information
2 characterizes therapeutic efficacy of the therapeutic agent in the microenvironment.

1 15. The method as claimed in claim 7, wherein the material has
2 an additive incorporated therein and wherein the point source is a desired point
3 source substantially smaller than a point source defined by a microbubble created
4 within the material without the additive.

1 16. The method as claimed in claim 15, wherein the additive
2 includes metal nano particles or domains.

1 17. The method as claimed in claim 1, wherein the microbubble
2 is produced by at least one laser pulse.

1 18. The method as claimed in claim 17, wherein the at least one
2 laser pulse includes a focused laser pulse.

1 19. The method as claimed in claim 1, wherein the microbubble
2 is produced by at least one ultrafast laser pulse.

1 20. The method as claimed in claim 19, wherein the information
2 characterizes a photodisruption threshold of the material.

1 21. The method as claimed in claim 1, wherein the information
2 characterizes location of the microbubble within the material.

1 22. The method as claimed in claim 1, wherein the information
2 characterizes microbubble behavior in the material.

1 23. The method as claimed in claim 4, wherein microbubble size
2 is determined using non-linear acoustic scattering from the microbubble.

1 24. The method as claimed in claim 1, wherein the material
2 includes a liquid or semi-liquid material, such as biological tissue.

1 25. An acoustic monitoring system in laser-induced optical
2 breakdown (LIOB), the system comprising:
3 means for causing at least one acoustic wave associated with a
4 microbubble to propagate in a volume of material;
5 an acoustic wave detector for detecting the at least one acoustic wave
6 to obtain at least one signal; and

7 means for processing the at least one signal to obtain information
8 which characterizes the material, the microbubble in the material or a
9 microenvironment of the microbubble.

1 26. The system as claimed in claim 25, the information
2 characterizes the mechanical microenvironment of the microbubble.

1 27. The system as claimed in claim 26, wherein the information
2 characterizes the viscoelasticity of the microenvironment.

1 28. The system as claimed in claim 25, wherein the information
2 characterizes microbubble size.

1 29. The system as claimed in claim 25, wherein the at least one
2 acoustic wave includes at least one acoustic wave reflected from the microbubble
3 and wherein the means for causing includes an acoustic source for directing acoustic
4 energy to the material so that at least one acoustic wave propagates through the
5 material to the microbubble to obtain the at least one reflected acoustic wave.

1 30. The system as claimed in claim 29, wherein the at least one
2 reflected acoustic wave includes an ultrasound wave.

1 31. The system as claimed in claim 25, wherein the at least one
2 acoustic wave includes an acoustic shock wave which propagates outwardly from
3 an LIOB site and which defines an acoustic point source.

1 32. The system as claimed in claim 31, wherein the microbubble
2 is LIOB-induced and wherein the acoustic shock wave defines position of the LIOB-
3 induced microbubble which acts as an acoustic reflector.

1 33. The system as claimed in claim 31, wherein the point source
2 is determined by location of an additive in the material and wherein the additive
3 enhances an electric field in the vicinity of the additive.

1 34. The system as claimed in claim 33, wherein the information
2 characterizes a photodisruption threshold of the material with the additive which is
3 substantially lower than a photodisruption threshold of the material without the
4 additive.

1 35. The system as claimed in claim 34, wherein the information
2 quantifies concentration of the additive.

1 36. The system as claimed in claim 35, wherein a single molecule
2 of the additive is detected.

1 37. The system as claimed in claim 33, wherein the material
2 includes at least one nanodevice having the additive and a linked therapeutic agent
3 and wherein at least one laser pulse causes the at least one nanodevice to release the
4 linked therapeutic agent into the microenvironment.

1 38. The system as claimed in claim 37, wherein the information
2 characterizes therapeutic efficacy of the therapeutic agent in the microenvironment.

1 39. The system as claimed in claim 31, wherein the material has
2 an additive incorporated therein and wherein the point source is a desired point
3 source substantially smaller than a point source defined by a microbubble created
4 within the material without the additive.

1 40. The system as claimed in claim 39, wherein the additive
2 includes metal nano particles or domains.

1 41. The system as claimed in claim 25, wherein the microbubble
2 is produced by at least one laser pulse.

1 42. The system as claimed in claim 41, wherein the at least one
2 laser pulse includes a focused laser pulse.

1 43. The system as claimed in claim 25, wherein the microbubble
2 is produced by at least one ultrafast laser pulse.

1 44. The system as claimed in claim 43, wherein the information
2 characterizes a photodisruption threshold of the material.

1 45. The system as claimed in claim 25, wherein the information
2 characterizes location of the microbubble within the material.

1 46. The system as claimed in claim 25, wherein the information
2 characterizes microbubble behavior in the material.

1 47. The system as claimed in claim 28, wherein the microbubble
2 size is determined using non-linear scattering from the microbubble.

1 48. The system as claimed in claim 25, wherein the material
2 includes a liquid or semi-liquid material, such as biological tissue.

1 49. The method as claimed in claim 1, wherein the information
2 includes an acoustic image of the material.

1 50. The method as claimed in claim 7, further comprising time
2 reversing the acoustic shock wave to form an acoustic image of the material.

1 51. The system as claimed in claim 25, wherein the information
2 includes an acoustic image of the material.

1 52. The system as claimed in claim 31, further comprising means
2 for time reversing the acoustic shock wave to form an acoustic image of the
3 material.
